

ITI123 Generative AI & Deep Learning Project (2025S2)

Learning Unit Objective

In this work integration unit, you will apply deep learning and generative AI techniques to solve a real-world business problem. Guided by principles of AI governance and responsible AI, apply the knowledge and skillsets acquired in other your other learning units to design, implement, and evaluate an AI solution. The solution should address your selected business challenge and demonstrate the ability to drive innovation with ethical considerations.

Learning Unit Outcomes

1. Analyse and evaluate the suitability of deep learning and generative AI models for a given business challenge.
2. Design a comprehensive deep learning and/or generative AI solution that incorporates the principles of AI governance and responsible AI.
3. Implement and demonstrate a working deep learning and/or generative AI solution that addresses the selected business challenge.

Deliverables/ Assessment Components schedule:

Deliverables / Assessment Components	Weightage	Due date
Project Proposal	20%	Sun, 21 Dec 2025, 2359 hrs
Milestone Report	35%	Thu, 29 Jan 2026, 2359 hrs
Final Report	35%	Thu, 26 Feb 2026, 2359 hrs
Presentation	10%	Wed 25 Feb 2026 / Thu 26 Feb 2026

Project Overview

This is an individual project. During each consultation session, project mentors are available to provide guidance and ensure you are on working on the right track towards your project proposal, reports and presentation.

Each learner will need to choose a focus area of either

1. Model development (training, fine tuning), or
2. Application development (using Generative AI services)

Proposals from earlier learning units cannot be reused as submission for this learning unit.

Overview of Focus Area

Stage	Model Development	Application Development
Project Proposal	Research and define a plan on identified problem area, possible dataset, or existing models that could be used to solve the selected problem.	Research and define a plan on identified problem area, available Generative AI services (core LLM services), scope of integration and expected outcome of the solution.
Milestone Report	Update the problem to be solved and provide discussion on experimental results and comparisons. • Data selection • Feature engineering • Model Selection and Architecture Design • Hyperparameter tuning and training.	Update the problem to be solved and provide progress updates and discussions of design decisions and feature implementations. • Feature design • Integration with software • Design decision
Final presentation	Highlight key individual contributions and demonstrate output and understanding of methodologies, results, and related development work.	
Final report	• Interpretability and explanation • Communications of results	• Effectiveness and completeness of solution.

	• Basic deployment (eg. via Gradio)	• Details of deployment platform
--	---	--

Project Proposal

In the project proposal, pick a business problem of your choice, formulating it as a deep learning problem or a development plan of Generative AI solution for your project.

Once you have identified the problem, it will be useful to research some prior work or research on related topics.

Model Development Focus

An important aspect of your project is to identify one or several datasets suitable for your chosen problem. You may search for existing data sources online or scrape for relevant information online.

Note that it is NOT recommended to collect your own data as it can take up a significant amount of time. Therefore, plan your project accordingly to pace your progress across the 10 sessions in this learning unit.

You are expected to have a solid methodology for deep learning development and discussion of results, so pace your project accordingly.

Format

Your project proposal should include the following information:

- **Formulation:** What problem are you going to solve? How do you frame it as a deep learning problem?
- **Method:** What deep learning techniques/architectures are you planning to apply?
- **Intended experiments:** What experiments are you planning to run? How do you plan to evaluate your deep learning models?
- **Application-based integration** - What features are you planning to develop? How do you integrate/deploy your model or services with the application?

Please also include pointers to one or more relevant dataset and one example of prior research on the topic in your project proposal.

Datasets

The availability of the dataset is important. For this project, we encourage learners to research and leverage existing (Deep Learning) DL architecture and data sets as a base model. If you choose a base model that comes with existing data sets, please provide a reference to the source of the data set.

You can consider available dataset available online, for example:

1. Spam mail and phishing mail detection (<https://www.kaggle.com/ozlerhakan/spam-or-not-spam-dataset>)
2. Face Recognition (<https://github.com/fwang91/IMDb-Face>)
3. Malware detection (<https://www.kaggle.com/c/malware-classification>)
4. Speech Recognition (<https://github.com/philipperemy/timit>)
5. Document On-Screen Recognition (<https://expressexpense.com/view-receipts.php>)
6. Casting manufacturing defective inspection (<https://www.kaggle.com/ravirajsinh45/real-life-industrial-dataset-of-casting-product>)
7. Detect customer emotion through speech (<https://www.kaggle.com/uwrfkaggler/ravdess-emotional-speech-audio>)
8. Understand customer service satisfaction level (<https://www.kaggle.com/teejmahal20/airline-passenger-satisfaction>)
9. Detect real or fake face through image (<https://www.kaggle.com/ciplab/real-and-fake-face-detection>)

Model Development (20 marks)

	Unsatisfactory 0 – 1 m	Need Improvement > 1 – 2 m	Meet Expectation > 2 – 3 m	Exceed Expectation >3 – 4 m	Outstanding >4 – 5m
--	---------------------------	-------------------------------	-------------------------------	--------------------------------	------------------------

Problem Formulation	The problem statement is missing, incoherent, or not framed as a DL problem.	The problem is vague, or the chosen deep learning framing is a poor match for the problem.	The business problem is defined and correctly framed as a general DL task. User needs are stated but may be general.	The business problem is clearly defined and framed as a specific DL task. The choice of framing is well-justified, and user needs are specific and detailed.	The business problem is compelling and expertly framed as a specific deep learning task with clear inputs, outputs, and user needs.
Dataset & Research	No dataset is identified, or no prior research is cited.	Identifies a dataset that is unsuitable, low-quality, or inaccessible. Cites research that is irrelevant, or the connection to the project is not explained.	Identifies a relevant dataset, but its justification, quality, or accessibility is weak or unclear. Cites a relevant research paper, but the connection to the project is general or superficial	Identifies a specific, appropriate, and accessible dataset with a clear justification for its use. Cites relevant research papers and clearly explains how they generally inform the project's goals or methodology	Identifies a specific, high-quality, and accessible dataset with a strong justification and direct reference. Cites highly relevant, research and provides an insightful explanation of how it specifically informs the project's design, originality, or evaluation.

Method (DL Architecture)	No methodology or architecture is proposed.	Proposes an architecture that is inappropriate for the problem, or the description is too vague.	Proposes a general, appropriate architecture but lacks specific detail or strong justification.	Proposes specific, appropriate DL architectures. Provides a clear and logical justification for why this architecture is suitable for the problem.	Proposes a specific, well-considered architecture. Provides a strong, insightful justification that compares this choice against alternatives and explains why it is optimally suited to the problem's specific data or constraints.
Experiments & Evaluation Plan	No experiment or evaluation plan is mentioned.	The experimental plan is vague. Evaluation metrics are missing, or the chosen metrics are incorrect for the task.	Lists a general experimental plan. Lists common metrics that are relevant	Details a clear experimental plan. Identifies specific and relevant evaluation metrics for the DL task with some justification.	Details a comprehensive experimental plan. Identifies specific, relevant and insightful suite of evaluation metrics for the DL task with strong and logical justification.

Application Development Focus

Explore currently available Generative AI services that are suitable for your chosen problem. You are expected to understand the platform, considering factors such as scalability and deployment. Define the features you would expect to be driven by your selected AI services or models as part of your development plan.

Please note that you will not be reimbursed for the cost of using your selected AI services except those provided by the school such as Gemini.

Format

Your project proposal should include the following information:

- **Formulation:** What problem are you going to solve? Clearly define the problem area and the user needs you are addressing.
- **Method & AI Services:** What available Generative AI services are you planning to use? Justify why this service is the right choice for your problem.
- **Integration & Features:** What is the planned scope of integration? What specific application features will you develop, and how will the AI service power them? Describe the expected outcome and how the user will interact with the solution.
- **Evaluation Plan:** How do you plan to evaluate the success and effectiveness of your final application?

Application Development (20 marks)

	Unsatisfactory 0 – 1 m	Need Improvement > 1 – 2 m	Meet Expectation > 2 – 3 m	Exceed Expectation >3 – 4 m	Outstanding >4 – 5m
--	---------------------------	-------------------------------	-------------------------------	--------------------------------	------------------------

Problem Formulation & User Need	The problem statement is missing, incoherent, or does not identify a clear need.	The problem is vague, too broad, or does not clearly connect to a specific user need.	The problem is generally defined. A user need is identified, but its connection to the problem is unclear	The problem is clearly defined and specific. User needs are stated and relevant. The user needs' connection to the project's goals is explained.	The problem is clearly defined, specific and well-scoped. User needs are clearly stated and relevant. The user needs are well-researched and clearly connected to the project's goals.
Method & AI Service Justification	No GenAI service is identified, or the choice is fundamentally incorrect.	A GenAI service is mentioned, but the choice is inappropriate for the problem, or the justification is missing/weak.	Identifies a general but appropriate service but does not specify a model. The justification is relevant but basic	Identifies a specific GenAI service and model. Provides a clear justification based on its key features and suitability for the task.	Identifies a specific Generative AI service/model. Provides a clear and strong justification based on a thorough analysis of diverse factors.
Integration, Features, & User Flow	No features or integration plan is described.	Features are vague. The integration scope or user interaction flow is undefined or confusing.	Describes some application features and a general user interaction flow. The link between the AI service and	Details most of the application features and a clear, step-by-step user interaction flow. The integration of	Details a comprehensive scope of application features, and the user's interaction flow is logical and well-described.

			the features is clear but lacks detail.	the AI service is logical and well-defined.	The integration of the AI service is strong, logical and well-defined.
Evaluation Plan	No evaluation plan is mentioned.	The evaluation plan is vague or inappropriate.	Proposes a general evaluation plan with limited specifics.	Proposes a clear plan to evaluate the application. Identified metrics are relevant but not specific or measurable.	Proposes a clear, specific, and measurable plan. The chosen metrics are insightful and directly tied to the project's goals

Milestone Report

Milestone (report) will help to make sure you're on track and should describe what you've accomplished so far, and very briefly say what else you plan to do. It should be written as an “early draft” of your final report so that you can re-use most of the milestone content in your final report. It would be helpful to make your milestone report concise and brief. If you think screenshots or video recordings will help to illustrate your ideas/progress, feel free to make a short video clip (max 10mins) to explain the progress.

Model Development Focus

Your milestone report (and final report) should focus on the problem to be solved, and provide discussion on experimental results and comparisons, etc. and should not be a tutorial/lecture on what LSTM is for example.

Format

The milestone report is mostly intended to get feedback from project mentors to make sure you're making reasonable progress. The milestone report should not exceed 8 pages, excluding references. Content in extra pages will not be assessed. Like the proposal, it should include:

- Motivation: What problem are you tackling, and what's the setting you're considering?
- Model Development:
 - Datasets: What are the datasets you are considering? Base model set? Self-collected? How is the data being preprocessed and augmented to make sure they conform to the "same/similar original" requirement?
 - Performance tuning and optimization - How do you improve the performance/accuracy of your model?
 - Methods: What deep learning techniques have you tried and why?
 - What are the inputs? How are the inputs being pre-processed?
 - What are the outputs to be predicted?
 - What architectures are used and why?
 - Preliminary experiments: Describe the experiments that you've run, the outcomes, and any error analysis that you've done. You should have tried at least one model to serve as the baseline.
 - Next steps: Given your preliminary results, what are the next steps that you're considering?

This is the continual assessment of your previous proposal.

Grades may be awarded to learners who use/augment the base model with:

- Self-labeled and self-generated dataset in training and testing, or
- Additional labeled generated dataset (which is not the same dataset used in the original source of your base model). If you use more datasets, please provide a reference to the source of the data set.

Model Development (35 marks)

Criteria	Unsatisfactory 0 – 1.5 m	Need Improvement > 1.5 – 3 m	Meet Expectation > 3 – 4.5 m	Exceed Expectation >4.5 – 6 m	Outstanding >6 – 7m
Problem & Data	The problem is not defined, or no data has been acquired.	The problem statement is vague. Data is identified but no significant preprocessing or augmentation has been done.	Clearly re-states the problem. Some details on the progress of data preprocessing. Dataset choices are clear, but justification is basic.	Clearly re-states the problem. Details completed data preprocessing and augmentation. Justifies dataset choices based on progress.	The business problem is compelling and expertly framed as a specific deep learning task with clear inputs, outputs, and user needs. Strong and well described data strategy that includes advanced handling of edge cases, to address specific model requirements.
Methodology & Progress	No tangible progress on model implementation.	The baseline model is not yet running, or the architecture is still vague and not implemented.	Has a baseline model implemented and running. The architecture is clear but may not be fully optimized or changed from the proposal.	Has implemented and is actively tuning the proposed architecture. Clearly explains inputs, outputs, and any changes made since the proposal.	Has implemented and is actively tuning the proposed architecture. Clearly explains inputs, outputs, and any changes made since the proposal. Demonstrates an efficient and systematic approach to model selection and optimization.

Preliminary Experiments & Analysis	No experimental results are presented.	Has run a baseline, but results are not clearly presented, or no analysis is provided.	Presents clear results from the required baseline model. Analysis is present but may be superficial or lack comparison.	Presents clear results from a baseline model and at least one other experiment. Provides some analysis and comparison, not just a report of metrics.	Presents a comprehensive evaluation comparing multiple experiments. Provide strong, clear analysis and comparisons, with excellent aid and visualizations.
Responsible AI	No mention of responsible AI.	Acknowledges responsible AI generically, but with no specific findings or actions.	Discusses potential biases/risks in progress. Mentions planned mitigation steps.	Discusses potential biases/risks in progress. Demonstrates some mitigation actions and details actions taken.	Discusses potential biases/risks in progress. Demonstrates specific mitigation actions and provides evidence of their effectiveness
Plan and Report Quality	No next steps are provided. Report lacks structure and appears to be a disorganized collection of data.	Next steps are a vague repeat of the original proposal. Report is unfocused or exceeds the page limit.	Next steps are logical and relevant to the project but may not be strongly tied to the results. Report is basic.	Proposes specific, logical next steps that are directly informed by the preliminary experimental results. Report is concise and well-written.	Proposes specific, logical next steps that are directly informed by the preliminary experimental results. Identifies potential future roadblocks and challenges. Report is compelling, concise and well-written.

Application Development Focus

Your milestone report (and final report) should focus on the business problem, the technical architecture, and the tangible progress of the application build. It should discuss the integration results and specific design choices and should not be a tutorial/lecture on general Gen AI concepts.

Format

The milestone report is mostly intended to get feedback from project mentors to make sure you're making reasonable progress. The milestone report should not exceed 8 pages, excluding references. Content in extra pages will not be assessed.

The milestone report should include:

- **Motivation:** What problem are you tackling, and the specific user needs
- **Application Development:**
 - What are the services or models being used and why?
 - What is the technical approach with regards to the data and tools?
 - How are the services or models integrated?
 - Design of completed and planned features?
 - What risks do you observe and how do you plan to mitigate them?
 - Next steps: Given your progress, what are the next steps that you're considering?

This is the continual assessment of your previous proposal.

Grades for the "Application Development" align with:

- **Operational Prototype:** Moving beyond theory to a working integration with the AI service.
- **Active Risk Mitigation:** Implementing concrete guardrails (input filters, prompt engineering constraints) rather than just discussing ethics generally.

Application Development (35 marks)

Criteria	Unsatisfactory 0 – 1.5 m	Need Improvement > 1.5 – 3 m	Meet Expectation > 3 – 4.5 m	Exceed Expectation >4.5 – 6 m	Outstanding >6 – 7m
Problem & Service	The problem is not defined, or no AI service is selected.	The problem statement is vague, or the AI service choice is not clearly justified.	Clearly re-states the problem. Justifies the AI service choice, but the reasoning is still mostly theoretical.	Clearly re-states the problem. Justifies the choice of AI service based on preliminary testing and integration experience.	Clearly re-states the problem. Justifies the choice of AI service based on preliminary testing and integration experience. Service selection is validated through comparative analysis or deep understanding of trade-offs.
Methodology & Integration Progress	No tangible progress on service integration.	Has chosen a service, but no functional integration has been built yet. The plan is still purely theoretical.	Has successfully connected to the AI service. The integration architecture is clearly mapped out.	Demonstrates functional data exchange with the service. The application sends actual inputs and parses the service outputs correctly. Integration is active, though error handling or edge cases may still need refinement.	Details a completed and working integration with the chosen AI service. The integration architecture is clearly demonstrated, robust, and effectively handles the application's requirements.
Feature Design & Preliminary Results	No features are designed or implemented.	Features are still in the design/ mockup phase. No working functionality is presented.	Demonstrates partial progress on a core feature. Discusses expected outcomes.	Demonstrates at least one completed core feature powered by the AI. Discusses specific results	Demonstrates some completed core features powered by the AI. Discusses specific

				and provides analysis	results and provides critical analysis
Responsible AI	No mention of responsible AI.	Acknowledges responsible AI generically, but with no specific findings or actions.	Discusses potential risks in progress. Mentions planned mitigations Shows clear progress on the proposed plan	Identifies specific risks observed from the GenAI service. Mitigation strategies are defined but may not be fully implemented.	Identifies specific risks observed from the GenAI service. Details specific guardrails or design choices already implemented to mitigate them.
Plan and Report Quality	No next steps are provided. Report lacks structure and appears to be a disorganized collection of data.	Next steps are a vague repeat of the original proposal. Report is unfocused or exceeds the page limit.	Next steps are logical and relevant but may not be strongly tied to analysis of the current build. Report is basic.	Proposes specific, logical next steps for new features or refinements that are directly informed by the current build. Report is concise and well-written.	Proposes specific, logical next steps that are prioritized by impact and feasibility. Identifies potential challenges or cost implications of chosen Gen AI services. Report is compelling, concise and well-written.

Final Report

Format

The final project report should not be more than 15 pages, excluding references.

Model Deployment Focus

Please include a section that describes/documents how your models are being developed and optimized. The best is to keep track of the history of model development logs, eg using MLFlows. The logs will provide the evidence of experiments conducted.

The report should include descriptions and appropriate discussions on the following:

- problem statements
- data sets summaries
- model summaries
- hyper-parameters
- epochs
- learning graphs
- testing loss/ accuracy
- possible improvement

Include evidence of basic deployment using tools such as Gradio.

Application Development Focus

Please include a section that describes/documents how you utilized your Gen AI services and implemented the application to solve the business problem. Details the tools, frameworks, and development direction you have chosen and evaluate the effectiveness of your solution.

Include a section that describes how the services are being deployed/integrated into the target platforms, etc. IoT system, robot, mobile app. etc, and determine how your solution is suitable and effective for your problem.

Code

Please include a zip file or preferably a link to a Github (or GitLab) repository with the code for your final project. You do not have to include the data or additional libraries (so if you submit a zip file, it should not exceed 5MB).

Please also include a short description of the files(codes) used in the projects.

Model Development (35 marks)

Criteria	Unsatisfactory	Need Improvement	Meet Expectation	Exceed Expectation	Outstanding

Originality & Completeness (10 Marks)	The solution is not original, not completed, and does not solve the project problem. (0 - <2m)	The solution is not original but solves the basics of the project problem. The model is trained and functional. (2 - <4m)	The solution shows some originality. It solves the problem effectively, demonstrating a level beyond default settings. (4 - <6m)	The solution demonstrates technical depth. The solution shows some originality. It fully solves the project problem with a robust implementation The approach is well-suited to the problem complexity. (6 - < 8m)	The solution demonstrates technical depth. The solution is very original or novel and fully solves the project problem. It demonstrates a unique insight or creative approach that significantly enhances performance. (8 - 10m)
Model Effectiveness & Evaluation (5 Marks)	Did not evaluate the model performance using relevant metrics or visualizations. (0 - <1m)	Evaluates the model performance using one or two relevant metrics but lacks depth. (1 - <2m)	Evaluates the model performance using several relevant and appropriate metrics for the task. (2 - <3m)	Evaluates model performance using several relevant and appropriate metrics and visualizations. Explains the meaning and significance of the results. (3 - <4m)	Evaluates model performance using several relevant and appropriate metrics and visualizations. Clearly explains the meaning and significance of the results. Discuss weaknesses and reliability of model. (4 - 5m)
Code (5 Marks)	Codes are incomplete, disorganized, and haphazard. No documentation. (0 - <1m)	Some codes are organized but may be incomplete or contain errors. Basic documentation for a few functions. (1 - <2m)	Most codes are well-organized. Good documentation for the main components. (2 - <3m)	All codes are well-organized, clean, and follow good practices. Documentation is clear and complete. (3 - <4m)	All codes are modular, well-organized, clean, and follow good practices. Documentation is comprehensive.

					Reproducibility is ensured via source control, configurations and clear instructions (4 – 5m)
Deployment (10 Marks)	No deployment or saved model. (0 - <2m)	Provides the final trained model with a description of how it could be deployed. (2 - <4m)	The model is deployed locally, and the process is manual. (4- <6m)	The model is deployed to a target platform such as Streamlit Cloud and Hugging Face Spaces, but the deployment process was manual (e.g., drag-and-drop) (6 - <8m)	The model is deployed systematically (e.g., containerized, automated script) and is functional on the target platform. (8 – 10m)
Report (5 Marks)	Poorly written. Lack of content and unstructured. (0 - <1m)	Content is present with some details, but report is not well-structured. (1 - <2m)	Well-written report with logical structure. Shows some details and depth. (2 - <3m)	Well-written report with logical structure. Content contains good detail and depth. (3 – <4m)	Well-written report with logical structure. Content is concise, and contains good detail, depth, and analysis. (4 – 5m)

Application Development (35 marks)

Criteria	Unsatisfactory	Need Improvement	Meet Expectation	Exceed Expectation	Outstanding
Originality & Completeness (10 Marks)	The solution is not original, not completed, and does not solve the project problem. (0 - <2m)	The solution is not original but solves the basics of the project problem. The app is built with basic features. (2 - <4m)	The solution solves the project problem fully with a complete set of features. However, the implementation is standard or predictable,	The solution shows clear originality and solves the project problem effectively. It is built with advanced features	The solution is very original or novel in its use of GenAI and fully solves the problem. It is polished and built with advanced features.

			lacking significant originality or customization in the GenAI application (4 - <6m)	beyond the basics. (6 - <8m)	(8 - <10m)
Application Effectiveness & Evaluation (5 Marks)	Did not evaluate the application's effectiveness or quality of AI output. (0 - <1m)	Evaluates the application's effectiveness using one or two basic methods. (1 - <2m)	Evaluates the application's performance using several relevant metrics. (2 - <3m)	Evaluates effectiveness using relevant metrics and user-centric method. Explains the significance of the results. (3 - <4m)	Evaluates effectiveness using relevant metrics and user-centric methods. Clearly explains the significance of the results, demonstrating the value of the solution (4 - 5m)
Code (5 Marks)	Codes are incomplete, disorganized, and haphazard. No documentation. (0 - <1m)	Some codes are organized but may be incomplete or contain errors. Basic documentation for a few functions. (1 - <2m)	Most codes are well-organized. Documentation exists for several functions. (2 - <3m)	Most codes are well-organized and structured logically. Documentation is clear and mostly complete. (3 - <4m)	All codes are well-organized, clean, and follow good practices. Documentation is comprehensive. Evidence of source control, configurations and clear instructions. (4 - 5m)
Deployment (10 Marks)	No deployment or non-functional app. (0 - <2m)	Provides application code with a description of how it could be deployed. (2 - <4m)	The application is functional and deployed locally but the process is manual. (4 - <6m)	The application is deployed to a target platform such as Streamlit Cloud or AWS, and is accessible, but the deployment process is manual (e.g., drag-and-drop upload) or lacks robustness. (6 - <8m)	The application is deployed systematically (e.g., containerized, automated script, CI/CD) and is fully functional, robust, and accessible on the target platform. (8 - 10m)

Report (5 Marks)	Poorly written. Lack of content and unstructured. (0 - <1m)	Content is present with some details, but report is not well-structured. (1 - <2m)	Well-written report with logical structure. Shows some details and depth. (2 - <3m)	Well-written report with logical structure. Content contains good detail and depth. (3 - <4m)	Well-written report with logical structure. Content is concise, and contains good detail, depth, and analysis. (4 - 5m)
------------------	---	--	---	---	---

Final Presentation (10 marks)

During the final presentation, you will be jointly assessed by more than one supervisor to ensure fairness in the assessment. Among other things, you are required to show and explain the work you have done. You will be assessed based on your demonstrated understanding of the methodologies used and experimental results.

Criteria	Unsatisfactory	Need Improvement	Meet Expectation	Exceed Expectation	Outstanding
Presentation (Individual) (Total: 10 marks)	- Unable to present content or is incoherent. - Unable to answer most of the questions. (0<2m)	- Some clarity and coherence in presentation - Able to answer some of the questions.	- Generally clear and coherent when presenting, - Demonstrate the deployment or workings of application with some issues - Able to answer	- Very clear and coherent when presenting, - Demonstrate the deployment or workings of application with minor issues	- Very clear, engaging and coherent when presenting, - Demonstrate the deployment or workings of application smoothly

		(2 <4m)	most of the questions (4 <6m)	• Able to independently answer all questions raised. (6-<8m)	• Able to independently answer all questions raised with deep insight and confidence. (8-10m)
--	--	---------	--------------------------------------	---	---
